Use your own domain

Show your galleries and inquiry form on your own web address, for example clients.yourstudio.com — with no “iwopo” in it. You add one record where your domain is managed; iwopo does the rest.

Step by step

1. In your iwopo panel, open “Settings → Web address”.
2. Under “Your own domain”, type the address you want (for example clients.yourstudio.com) and press “Connect”.
3. iwopo shows you one record to add (two for a main domain). Keep that page open.
4. Sign in where you bought your domain and open its DNS settings (often called “DNS”, “DNS records” or “Advanced DNS”).
5. Add a new record exactly as iwopo shows it — Type, Name and Value — and save.
6. Back in iwopo, press “Check now”. It turns “Active” within minutes (at most a day), and the padlock (https) is added for you.

Example record

Type	Name	Value
A	`clients`	`x.x.x.x`

Use the exact Name and Value shown in your iwopo panel.

Where is DNS at my domain company?

GoDaddy · Namecheap · Cloudflare · Hostinger · Squarespace · Wix · IONOS · Bluehost

DNS · DNS records · Manage DNS · Advanced DNS

Good to know

- Do not delete your other records — your email keeps working as before.
- Your old iwopo links keep working too.
- Stuck? Send us a message from “Help & Support”, with a screenshot.
